Prestta™ Octa-Band LTE/Cellular SMT Antennas

Purpose
This document provides information for application KYOCERA AVX's Narrow Band 1004795 /1004796 standard embedded LTE Cellular antenna into wireless products. Specifications, design recommendations, board layout, packaging and manufacturing recommendations are included.

This document provides information for incorporating KYOCERA AVX's Prestta standard embedded LTE Cellular antenna into wireless products. Specifications, design recommendations, board layout, packaging and manufacturing recommendations are included.

This document is divided into two parts: a main section and appendices. The main section addresses points and issues common to all products. The appendices provide product-specific information.

Overview

The Prestta LTE Product Line

The Prestta Standard Octa-Band LTE Cellular antenna, listed below, represents a new category of internal IMD antennas. KYOCERA AVX antennas utilize proprietary and patented Isolated Magnetic Dipole (IMD) technology to meet the needs of device designers for higher performance; providing greater than 55% average efficiency across a very wide band covers all LTE and Cellular bands (700MHz, 850MHz, 900MHz, 1800MHz, 1900MHz, 2100MHz, and 2700MHz). Standard, off-the-shelf, antennas lower total costs, enable quicker time to market and work with a variety of designs.

*Appendix 1 gives details instructions on (600-960 MHz) matching.

Difference between 1004795 and 1004796

The two LTE antennas 1004795 and 1004796 are using the same design and same dimensions. 1004796 is the mirrored antenna of 1004795, which should have same performance as 1004795.

Using the mirrored version 1004796 or the original 1004795 will be defined depending on the preferred location for the antenna feed on your board.

Additional antennas are under development, please see KYOCERA AVX'ss Website, or ask Ethertronic's sales person about additional products to meet your needs.
IMD Technology Advantages

Real-World Performance and Implementation

Other antennas may contain simple PIFA or monopole designs that interact with their surroundings, complicating layout or changing performance with user position. KYOCERA AVX’s antennas utilize patented IMD technology to deliver a unique size and performance combination.

Smallest Effective Size

Unlike antennas using other technologies, IMD antennas require minimal ground clearance and keep-out areas for surrounding components. This can lead to a smaller “effective” size when all factors are taken into account. In addition to a ultra-thin, end-user device designs.

IMD Technology: How it works

IMD technology uses confinement of the electrical field to create the antenna’s mode. The strongly confined antenna mode reduces its coupling to the surrounding environment. The diagram to the right shows the electrical field created on the PCB ground plane for an KYOCERA AVX IMD antenna and a PIFA (Planar Inverted F Antenna). Red areas indicate the highest current while blue areas signify the lowest. As demonstrated, currents from the IMD design are highly localized, while high currents are observed all the way over to the ground plane edge on the PIFA.

KYOCERA AVX’s IMD antennas are ideally suited for wireless data devices, where performance, size and system costs are critical. The surface mount design and compact size are suited for high volume applications. Standard antenna profiles are available or can be configured to suit individual OEM requirements.

Antenna Tuning Guidelines

All tuning is done through the PCB layout or matching circuit value. There are three ways to tune the antenna using the PCB layout:

- Major tuning through the tuning pad printed on the PCB
- Minor tuning through the matching network
- Change of the antenna location and varying board size

Major Tuning Through the Tuning Pad Printed on the PCB

A common effect of shield cans, housing and other close by components on the antenna performances is frequency shift. To offset the detuning effect, the PCB includes printed Tuning Pads. The low band tuning pads mainly control the 2nd frequency mode of low band and high band tuning pads impact the 2nd frequency mode of high band. The general control rule is that the larger number of tuning pads are connected, the lower the frequency is shifted. Figure 6 represents the tuning pads on the back of the antenna footprints.

Table 1 defines the (698-960 MHz & 1710-2400 MHz) tuning configurations

Table 2 defines the High band (2500-2700 MHz) tunings configurations

Table 2: (2500-2700 MHz) Tuning Pad Configurations

Product specifications subject to change without notice.
Minor tuning through the matching network

Performance can be also improved by tuning the matching circuit. In general, low band resonance is mainly affected by P1 and S1, while high band resonance is affected by P2 and P4. By adjusting the value of matching components, it is possible to control slight resonance shifts and optimize coupling between neighboring resonances. Optimum matching values may vary with different board transmission line designs and antenna working environments. The following page shows the Return Loss variation with different matching values of each component using KYOCERA AVX 125mm x 45mm demo board 1004795-01 or 1004796-01. Each baseline matching value is adjusted one value higher and one value lower to show the impact on performance within the demo board.

Figure 8 represents the matching circuit on the front of the antenna footprints. Figure 9 and 10 plots the return loss variations based on the different matching circuit values.

Figure 7: Return Loss plots of Major Tuning Configurations

S1: 4.7pF (Baseline), 4.0pF, 5.6pF
P2: 0.3pF (Baseline), 0.2pF, 0.4pF
P4: 0.5pF (Baseline), 0.4pF, 0.6pF

(2500-2700 MHz Tuning)

(698-960 MHz & 1710-2400 MHz Tuning)

Demo Board Front View

50ohm
The board size and antenna location are the most important factors for antenna performance. The ideal PCB size is 125x45mm. In general, the smaller the board size, the lower the low band performance will be. Nevertheless, antenna performance can be improved by modifying the tuning pad and optimizing the matching components accordingly. Here are some studies to help identify the best antenna location in different board sizes and shapes configuration.

**Study 1:** Antenna performance variation using different PCB length.
The optimum PCB length is 140mm, this is especially true for the low band performances. Antenna performances may degrade if the PCB is shorter or longer. Using a shorter length PCB from recommended reduces low band bandwidth and high bandwidth will become narrow if the PCB length is too long. Recommended PCB length range is from 120mm to 160mm.

**Study 2:** Antenna performance variation with different PCB widths on different sides of the board. Antenna performance may degrade if additional ground is added on either side of the board. Adding ground on the left-side impacts the low band performance while extra ground on the right-side impacts the high band. Lengths tested range from baseline width of 45mm to 90mm total width on demo board. Board tested with extensions on both left and right side of the demo board.

**Study 3:** Antenna performance variation based on antenna location on large PCB. If both width and length of the PCB exceed 130mm, the preferred antenna location is changed to the right corner of the PCB.

Appendix 1 600MHz Tuning

The 1004795 and 1004796 can be tuned via matching circuit for low band coverage extending down to 600MHz. Additional bandwidth coverage in low band is achieved without modifying antenna pattern or board layout.

Manufacturing and Assembly Guidelines

KYOCERA AVX's Prestta™ antennas are designed for high volume board assembly. Because different product designs use different numbers and types of devices, solder paste, and circuit boards, no single manufacturing process is best for all PCBs. The following recommendations have been determined by KYOCERA AVX, based on successful manufacturing processes.

These antennas are designed for automated pick and place surface mounting. However, as with any SMT device, KYOCERA AVX antennas can be damaged by the use of excessive force during the handling or mounting operation.

Component Handling Recommendations

The following are some recommendations for component handling and automated mounting:

- KYOCERA AVX Standard 1004795/1004796 antennas ship in tape and reel.

KYOCERA AVX's antennas are not moisture sensitive, and the ceramic antennas meet the requirements for a Level 1 classification of J-STD-020A (moisture/reflow sensitivity classification for non-hermetic solid state surface mount devices from the Institute for Interconnecting and Packaging Electronic Circuits). Nevertheless, as a precaution to maintain the highest level of solderability, KYOCERA AVX antennas are dry-packed.

Paste Stencil Recommendation

KYOCERA AVX recommends application of paste stencil to a thickness of 0.1mm, applied to within 0.125 mm of the solder mask surrounding each exposed metal pad on the PCB. PCB layouts for each antenna are provided in earlier section of this document.

Soldering Recommendations

The recommended method for soldering the antenna to the board is forced convection reflow soldering. The following suggestions provide information on how to optimize the reflow process for the antenna:

*Adjust the reflow duration to create good solder joints without raising the antenna temperature beyond the allowed maximum of 260° C.
Additional Manufacturing Recommendations

Care should be taken during certain customer-specific manufacturing processes including PCB separation and Ultrasonic Welding to ensure these processes don't create damage to the components.

Cleaning Recommendations

After the soldering process, a simple wash with deionized water sufficiently removes most residues from the PCB. Most board assembly manufacturers use either water-soluble fluxes with water wash, or "no clean" fluxes that do not require cleaning after reflow.

Acceptable cleaning solvents are CFC alternatives, Isopropyl Alcohol (IPA), and water. If the application uses other types of solvents, please consult with KYOCERA AVX.

Cleaning processes that should be avoided are ultrasonic cleaning and any abrasive techniques, such as scrubbing with a cotton swab or with an abrasive material.

Rework & Removal Recommendations

There may be a need to rework or remove the antenna from the PCB. Although KYOCERA AVX's antennas are designed for ease-of-use, use care when separating them from the PCBs. Careless heating or removal of the antenna can cause thermal, mechanical or lead damage. These degradations may render the antenna useless, impeding any failure analysis and preventing the reuse of the device. Therefore, it is recommended to observe the following precautions:

- The component can be reworked and soldered by hand using a soldering iron. However, care should be used so the temperature does not exceed 260°C. The soldering iron should not touch the composite material while soldering the leads of the antenna.
- The component can be reworked and soldered using a hot air rework station. However, care should be taken to ensure that the temperature does not exceed 260°C.
- Once the solder on the PCB is sufficiently heated, use a vacuum pen to lift the antenna straight up off the PCB. Avoid twisting or rotating the device while removing it.

Tape & Reel Specifications

Product will be shipped in Tape and Reel packaging.
